

Complete Next.js Techno-functional Specification

Detailed module documentation for implementation in Next.js: scope, data, rules, workflows, controls, source procedures, and testable outcomes.

Coverage	Source basis	Implementation stance
All Nation CBS business modules; detailed Loans and Security section; complete procedure and field catalogues	665 AL files: custom tables/extensions, service codeunits, pages, reports and configuration	Business implementation reference - source behavior is catalogued; policy values are explicitly configurable

Prepared 17 August 2026 | Complete implementation reference

1. Purpose, boundary and reading guide

This document is intentionally implementation-focused. It describes the behavior the Next.js system must provide, while identifying where exact financial policy must be confirmed with the SACCO.

In scope: loan product policy, member loan application, calculator and appraisal, guarantors and collateral, approvals, creation/disbursement, schedules, billing/accrual/penalties, repayments, restructuring/moratorium, recovery, batch disbursement, and channel applications.

Out of scope: exact GL posting-account numbers, rate values, approval thresholds, external provider payloads, and legal retention values. The supplied source identifies these controls but does not provide a validated business configuration package.

Every item marked **policy** must be made configurable, versioned and approval-controlled in the Next.js implementation. Do not hard-code SACCO rates, multipliers, penalty rules, recovery priority, or workflow thresholds.

2. End-to-end loan lifecycle

Product setup -> application -> validation / appraisal -> security capture -> submit -> approve -> create loan account -> disburse -> schedule + ledger -> accrue / bill -> collect -> classify / recover -> close
-> restructure or moratorium -> revised schedule -> continue servicing

The UI should render a single Loan workspace with tabs: Overview, Application, Appraisal, Securities, Guarantors, Documents, Approvals, Disbursements, Schedule, Transactions, Arrears, Recovery, Restructure, Audit. Each tab has explicit action eligibility based on state and role.

State	Permitted operational meaning	Required control
Draft	Application can be edited; no financial effect	Creator-only changes; required fields and documents tracked
Pending approval	Awaiting configured decision	No material edits; approval trail and comments
Approved	Credit decision accepted but not yet posted	Revalidate eligibility and security before disbursement
Disbursed / Posted	Financial account and entries exist	No delete/edit; corrections are reversal, recovery, or restructure
In arrears / default	Servicing indicator, not a replacement for posted state	Derived from schedule vs paid data; collection actions audited
Closed	Balances settled and closing criteria met	No new postings; retain reports/attachments/audit
Rejected / Reopened	Application returned for change	Comment mandatory on rejection; re-submission creates audit transition

3. Submodule 1 - loan product policy and pricing

Purpose: define what can be borrowed, by whom, on what terms, and how interest, charges, penalties, securities, and posting behave. It is the first dependency for every other loan action.

Configuration object	Functional use	Next.js implementation rule
Product	Product code, posting type, source, eligibility, interest rate/method, repayment behavior	Effective-date every financial setting; approved version must be snapshot on loan approval
Interest band	Maps min/max installments to interest rate and processing fee	Exactly one active band must match the selected term; reject overlapping active ranges
Charge setup	Charge code, calculation type, source charge, posting destination	Use a safe expression engine / declared formulas; test every configured formula
Loan product constraints	Maximum repayment period, multiplier, salary/deposit rules, disbursement/loan account mappings	Model as explicit configuration fields and validation policies, not hidden UI conditions

Pricing logic evidenced by the source: on product/term selection, the loan reads the product interest rate and repayment method; where interest bands are active, it selects the band where min installments $\leq$ selected installments $\leq$ max installments. Product charges are calculated from product charge setup and may evaluate a configured formula against a base amount. The proposed system must show the formula result and every charge line before submission.

4. Submodule 2 - loan application and pre-appraisal

Purpose: collect the requested credit, resolve member/product context, calculate a transparent offer, and prevent invalid submissions before an approver sees them.

Step	Functional logic	Implementation / evidence
Create	User chooses member, product, requested amount, term, payment/disbursement option	Load product version, member profile, existing loans, deposits, member accounts and required documents
Derive	System derives rate, repayment method, proposed start/end, monthly principal/interest/total, charges and net amount	Persist a calculation snapshot; the user sees formula inputs and outputs
Pre-appraise	System builds appraisal accounts, salary/deposit information, existing obligations, securities/guarantee eligibility	Never overwrite user-entered values silently; distinguish calculated vs manually overridden values
Validate	Run product, age/KYC, account, term, affordability, duplicate, security and required field checks	Return field-level errors and a business-readable rejection reason
Submit	Freeze application values and send to configurable workflow	Create ApprovalRequest, attachments/checklist snapshot and audit event

Minimum validation checklist from the source: member and product must exist; loan amount and repayment term must be valid; product has interest/repayment settings; selected interest band must exist when bands are used; required disbursement/account and posting setup must exist; appraisals must be committed; guarantee/witness eligibility is checked; duplicate-loan and product-specific rules are evaluated. Exact policy thresholds require business confirmation.

5. Submodule 3 - appraisal and affordability

The calculator records current deposits, loan-deposit multiplier, outstanding loans, deposit appraisal, product, principal, rate, repayment start, installments, earnings, deductions, net income, and amount available. Appraisal accounts record account type, account, balance and multiplied value.

Implement an **appraisal engine** that produces a dated immutable result: availableDepositCapacity, grossIncome, deductions, netIncome, existingDebtService, proposedInstallment, debtServiceRatio, guarantorCapacity, collateralCapacity, recommendedAmount, and exceptions. Calculations must be versioned by policy/effective date. Where staff override a computed value, require reason + approved authority.

The source distinguishes deposit, salary/FOSA, self-guarantee, non-self-guarantee, special-loan and channel-appraisal paths. Present them as selectable product policies, not separate unmaintainable screens.

6. Submodule 4 - guarantors and security management

Purpose: capture member guarantees and substitute/release them safely over the life of a loan. A guarantee is an allocation of member capacity to a loan; it must not be represented as a plain editable amount after approval.

Process	Source-backed behavior	Next.js control
Capture guarantee	Guarantee stores member deposits, multiplied deposits, guaranteed amount, outstanding guarantees, available guarantee, self-guarantee and substitution state	Lock guarantor capacity in one transaction; reject concurrent overallocation
Calculate outstanding liability	For an active guarantee, source calculates ratio = guaranteed amount / approved amount, then outstanding = loan balance * ratio, capped by total guarantee; substituted guarantee has zero ratio	Store calculation inputs and result; use Decimal; show current amount and cap in UI
Eligibility	Self and non-self capacity considers deposits, configured multipliers and existing outstanding guarantees	Implement reusable eligibility command with policy version and result explanation
Substitution / release	Security-management header and lines identify existing security, qualified/original/proposed remaining guarantee and replacement amounts	Require new allocation to pass before old allocation can be released; approval then post atomically
Recovery	Recovery process can allocate member/guarantor amounts and calculate guarantor ratios	Cap recovery at outstanding liability and available recoverable balance; generate notice/audit

Recommended invariant: for each guarantor, `sum(active allocation outstanding)` must never exceed configured eligible capacity; for each loan, the sum of approved guarantee/security allocation must meet the product's required coverage rule. Use row locking or `SERIALIZABLE` transaction isolation for allocation changes.

7. Submodule 5 - collateral registration, linking and release

Collateral application captures the member, category/type, description, multiplier, valuation, guaranteed value, last valuation date, joint ownership, owner identifiers, images/documents, registration/serial number, insurance and tracking dates, multi-linking option, cheque/reference, location/county, approval status and posting flags. Upon approval, it is posted to the collateral register.

Stage	Business logic	Required outcome
Register application	Capture collateral evidence and ownership; calculate policy-qualified guarantee from value and multiplier	Document checklist, valuation date, PII protection, duplicate serial/registration check
Approve and post	Create registered collateral record from approved application	Immutable link to application; retain attachments and approved valuation snapshot
Link to loan	Loan Securities connects loan, security type/code, security value, guarantee, member, linked-loan balance and substitution state	Validate collateral availability; multi-link only when policy permits; record allocation not merely a single linked loan
Outstanding value	Source allocates collateral responsibility proportionally using loan balance, total securities / total guarantees, and individual security guarantee / total securities	For Next.js, retain this as a validated calculation policy; expose formula and inputs. Confirm with finance before use for recovery/release.
Release / collect	Collateral Release records release reason, linked balance, collector identity/contact, collection date, status and posting	Only allow when linked balance / required coverage rules permit; approval is mandatory; preserve release acknowledgement

8. Submodule 6 - approval, loan creation and disbursement

The source has explicit workflow events for loan application, loan disbursement, loan restructure, collateral application/release, loan-security management and loan recovery. The Next.js workflow must use document-specific state transitions with maker-checker restrictions and decision comments.

Command	Preconditions	Atomic results
submitLoan	Draft, validation/checklist passes, calculation snapshot present	Freeze proposal, create approval request, write audit event
approveLoan	Assigned approver, workflow step open, no conflict of interest	Decision record, application becomes Approved, no posting yet
createLoan	Approved application, product/account setup valid	Loan number and loan account; copy/snapshot approved product/rate/term/security data
disburseLoan	Approved loan, security remains valid, available disbursement amount, posting date open	Balanced accounting transaction, disbursement record, schedule (if required), status/posted time, outbox notification
postBatch	Approved batch with eligible lines, each loan revalidated	One result per line; failed lines isolated/reportable; batch totals reconciled
reverseDisbursement	Authorized correction only, original transaction reference supplied	Balanced reverse entries; no destructive edits; status and audit trail updated

Disbursement data includes mode, account, first disbursement, fully-disbursed, batch, payment bank/branch/account/name, insurance, charges, recoveries, net amount and posting reference. For each disbursement, provide a preview showing gross amount, less charges/recoveries/insurance, net payable, destination, and accounting impact before final post.

9. Submodule 7 - repayment schedules, accrual and servicing

Schedule tables carry document/loan reference, expected date, description, principal repayment, interest repayment, monthly repayment and running balance. The calculator has the equivalent projection lines. Treat an approved schedule as an immutable version; create a new version after a formal restructure, never overwrite a posted schedule.

Service	Logic required	Control
Schedule generation	Generate due dates from repayment start / term and product frequency; calculate principal, interest, installment and running balance	Totals equal approved principal and scheduled interest within rounding rule; final installment absorbs residual
Amortised method	Source uses rate-based annuity calculation for amortised loans; per-annum vs periodic rate matters	Policy stores rate basis and rounding; calculation is tested with golden examples
Other methods	Source contains alternative repayment method paths including reducing/straight-line style logic	Define calculation method enum and published formulas; do not infer from labels alone
Interest accrual/billing	Source supports accrued daily interest, standard interest billing and upfront interest	Separate accrual (estimate/receivable) from posting; idempotency keyed by loan/date/run
Penalty	Source calculates penalty with freeze flag, penalty balance and last penalty date	Penalty policy is configurable; do not levy twice for same condition/date; support suspension/freeze
Repayment	Recovery/posting allocates payment to loan components and updates derived balances	Use configured allocation waterfall - typically fees/penalty/interest/principal only after confirmation; transaction lines remain source of truth

10. Submodule 8 - arrears, classification and collections

The loan record exposes defaulted days, loan classification, defaulted installments, total/principal/interest arrears, last pay date, last interest/penalty charge, debt collector fields, recovery totals and notice pathways. These are mainly derived operational measures and should be projections calculated from schedule and ledger data at an as-of date.

Arrears algorithm: for each due schedule line at the as-of date, compare due principal/interest/penalty with settled components; aggregate unpaid due amounts; derive earliest overdue date and defaulted days; classify using configurable ageing bands; persist daily snapshot for reporting but recompute on demand for investigation. Notices must record template/version, recipients, delivery outcome and approval where required.

11. Submodule 9 - moratorium, restructure and recovery

Loan Moratorium stores type, loan/product, current principal, moratorium date/period/start/end, remaining installments, restructure date, new repayment start/end, current/new monthly installment, repayment period, status and posting audit. Source logic can freeze principal, interest, or both during the moratorium period; restructure generates revised repayment behavior.

Action	Detailed functional behavior	Post / audit rule
Moratorium request	Select loan, type (principal, interest, full repayment, or configured type), dates, period and reason; derive remaining installments/current balance	Validate dates and required period; approval required; preserve schedule version before change
Post moratorium	Build a revised schedule from the effective date; zero principal and/or interest during the moratorium according to type; retain remaining balance	Create schedule version and document reference; never overwrite paid history
Restructure	Recalculate balance, term and new installment. Source has amortised formula and rate-basis branches	Require credit approval and disclosure; capture original/revised terms and reason; accounting impact separately approved
Recovery case	Recovery header gathers loan, accrued interest, total recoverable, self/member deposits, guarantor recovery and balances; lines hold member/guarantor recovery amount/type	Calculate recoverable caps; approval before post; create linked recovery/disbursement/accounting records
Recovery post	Source may create recovery-linked loan effects and post accrued interest before completing recovery	Use one database transaction or a compensating workflow; every source/recovery line maps to journal lines and notices

Never use a moratorium or restructure screen to change historical ledger postings. It is a forward-looking contractual change plus, where necessary, separately approved accounting adjustments.

12. Submodule 10 - channel loan applications

Channel Loan Application mirrors most core loan fields: member/product, amounts, rate/method, dates, statuses, account/billing/disbursement, balances, arrears, sector, recovery, security, income and portal fields. Implement it as a **source channel** on the same LoanApplication aggregate, with extra channel metadata and stricter idempotency, rather than duplicating the entire loan model.

Required logic: authenticate callback or channel user; validate channel reference uniqueness; identify active member; load product/channel eligibility; run the same appraisal/loan-band policy; store raw request and consent; return a deterministic decision/next status; hand off to standard approvals/disbursement. No mobile/channel route may bypass the core approval, security or posting controls.

13. Required screens, APIs and roles

Screen / API	Key actions	Who can act
Loan work queue / GET /loans	Filter by state, product, branch, arrears, owner; export authorized view	Credit, collections, supervisor
Application detail / POST /loan-applications	Draft, calculate, validate, submit, reopen	Credit officer / maker
Appraisal / POST /loans/:id/appraise	Recalculate, view affordability/security evidence, override with reason	Credit officer; approver for overrides
Guarantors / securities	Add, allocate, substitute, request release	Credit officer; security operations
Collateral register	Register, attach valuation, link/unlink, release	Security officer; approver
Approval inbox	Approve/reject/escalate; view audit and documentation	Configured approvers only
Disbursement / POST /loans/:id/disburse	Preview and post; batch submit/post; reverse authorized transaction	Finance / disbursement officer
Servicing	View schedule/ledger; accrue/bill; post repayment; freeze penalty	Finance / collections
Restructure/recovery	Request, approve, post; issue notices	Collections / credit / approver
Reports	Schedule, register, balances, ageing, appraisal, recovery, guarantor/collateral	Role-scoped operations/finance

API rule: use command endpoints for every state/financial action, for example POST /api/loans/{id}/submit, /approve, /disburse, /repayments, /restructures, and /recoveries. Each command requires idempotency key, server-side authorization, transaction boundary, audit event and useful error result.

14. Test pack and acceptance cases

Case	Expected result
Interest-band boundary	Min/max term selects exactly one active band; no band/overlap blocks submission
Loan appraisal	Member with existing loans/guarantees receives reproducible capacity result and reasoned exceptions
Guarantee concurrency	Two applications cannot reserve the same guarantor capacity beyond its eligible limit
Collateral link/release	Collateral cannot be released while coverage or linked balance rule fails; approval and receipt recorded
Disbursement idempotency	Repeated request with same key creates one posting and returns same response
Schedule rounding	Schedule principal sums exactly to approved principal; last installment reconciles rounding
Partial repayment	Configured allocation waterfall creates balanced entries and correct derived balances
Moratorium	Principal/interest/full types alter only future schedule components according to policy; paid history unchanged
Channel duplicate	Same verified external reference is processed once despite retry/delayed callback
Recovery	Member and guarantor recovery never exceeds configured outstanding/recoverable amounts; journals/notices traceable

15. Cross-module implementation catalogue

This section extends the loan/security specification into every functional area in the supplied extension. Use the module catalog for work planning and the subsequent procedure/field catalogues for traceability and full data coverage.

Module	Primary source services / submodules	Implementation obligations
Members and accounts	Member applications, edits, KYC, accounts, activation, withdrawal, ATM/mobile enrolment, advice	Identity validation, duplicate control, default accounts, lifecycle approvals, PII protection, statements and audit
Products and pricing	Products, categories, charges, interest bands, product management	Effective-dated product rules, rate/charge calculation, controlled configuration and eligibility
Loans and security	Application, appraisal, schedules, guarantees, collateral, disbursement, billing, recovery, restructure	Detailed in sections 3-14; use immutable financial and schedule versions
Payroll and checkoff	Employers, payroll codes, uploads, calculations, variations, advice	Stage/validate/approve/post import; retain raw rows/errors and reconcile totals
Fixed deposits	Deposit types/accounts/schedules, accrual and maturity	Rate/maturity policy, approval where needed, ledger postings and certificates
Teller, FOSA and cash	Teller transactions/setup, FOSA, denominations, cash management, journal vouchers	Till entitlements, balanced posting, denomination/reconciliation and receipt trace
Payments and channels	Standing orders, PesaLink, B2B, account instructions, external/channel transactions	Idempotent references, signed callbacks, state history, settlement and reconciliation
ATM/mobile/communications	Cards, ATM/mobile applications and ledger, bulk SMS/notifications	Masked tokens, approval/enrolment, safe inbound transaction/reversal, delivery outbox
Shares and dividends	Share trading/floating/transfers, dividend header/lines/recoveries	Frozen calculation run, controlled recovery/distribution, one-time posting and slips
Compliance and custodial	AML checks, liens, documents, custodial services/movement	Role-limited evidence, approvals, immutable movement and access audit
Administration and reporting	Setup, lookup values, jobs, role centre/cues, 98 reports	Audited configuration, idempotent jobs, scoped reports, saved parameters/cutoffs

Global process transfer rules

Every source procedure below must be assigned to one Next.js domain service. Financial mutation procedures become authenticated server-side commands; scheduled procedures become queue jobs; integration procedures become adapters/outbox workers; calculation and validation procedures become deterministic, unit-tested policies. Preserve the process result and audit evidence, but do not recreate Business Central page triggers or database-side side effects in the browser.

16. Complete source procedure and process catalogue

Every declared procedure in the 28 supplied codeunits is listed for traceability. The target designation tells the implementer where to place it; the existing AL procedure remains the definitive behavior to characterize with examples before migration.

Implementation note: field dictionaries document the supplied source's declared data. Before database migration, run a formal mapping workshop to identify deprecated fields, derived FlowFields, duplicated display values, sensitive fields and mandatory historical records. The target model should not copy every display field where it can reliably be obtained via a foreign key/read model.
